**Important**

This specification is draft. Feedback is welcome. Please write us at ces.qwi.feedback@census.gov.

The public-use data from the Longitudinal Employer-Household Dynamics Program, including the Quarterly Workforce Indicators (QWI) and Job-to-Job Flows (J2J), are available for download with the following data schema. These data are available as Comma-Separated Value (CSV) files through the LEHD website's Data page at <http://lehd.ces.census.gov/data/>.

This document describes the data schema for LEHD files. For each variable, a set of allowable values is defined. Definitions are provided as CSV files, with header variable definitions. The naming conventions of the data files is documented in [lehd_csv_naming.html](#). Changes relative to the original v4.0 version are listed [at the end](#).

1 Basic Schema

Each file is structured as a CSV file. The first columns contain [\[identifiers\]](#), subsequent columns contain [\[indicators\]](#), followed by [status flags](#).

1.1 Generic structure

| Column name |
|-------------------|
| [Identifier1] |
| [Identifier2] |
| [Identifier3] |
| [...] |
| [Indicator 1] |
| [Indicator 2] |
| [Indicator 3] |
| [...] |
| [Status Flag 1] |
| [Status Flag 2] |
| [Status Flag 3] |
| [...] |

Note: A full list of indicators for each type of file are shown below in the [Indicators](#) section. While all indicators are included in the CSV files, only the requested indicators will be included in data outputs from the LED Extraction Tool.

1.2 Identifiers

Records, unless otherwise noted, are parts of time-series data. Unique record identifiers are noted below, by file type. Identifiers without the year and quarter component can be considered a series identifier.

1.2.1 Mapping for Identifiers

([lehd_mapping_identifiers.csv](#))

Each of the released files has a set of variables uniquely identifying records (*Identifiers*). The table below relates the set of identifier specifications to the released files. The actual CSV files containing the identifiers for each set are listed after this table. Each identifier can take on a specified list of values, documented in the section on [Categorical Variables](#).

1.4 Variability measures

The following tables and associated mapping files list the variability measures available on each file. The '*Variability Measure*' is the short name of the variable on the CSV files, suitable for machine processing in a wide variety of statistical applications. When given, the '*Alternate Name*' may appear in related documentation and articles. The '*Variable Name*' is a more verbose description of the variability measure.

Six variability measures are published:

- Total variability, prefixed by vt_
- Standard error, prefixed by st_, and computed as the square root of Total Variability
- Between-implicate variability, prefixed by vb_
- Average within-implicate variability, prefixed by vw_
- Degrees of freedom, prefixed by df_
- Missingness ratio, prefixed by mr_

A missing variability measure indicates a structural zero in the corresponding indicator. This is currently not associated with a flag.

2.13 Geography

2.13.1 Geographic levels

Geography labels are provided in separate files by scope. Each file *label_geography_SCOPE.csv* may contain one or more types of records as flagged by *geo_level*. For convenience, a composite file containing all geocodes is available as *label_geography.csv*. The 2014 vintage of Census TIGER geography is used for all tabulations as of the R2015Q3 release.

(*label_geo_level.csv*)

| geo_level | label | description | sourceurl |

| B | Metropolitan/Micropolitan (complete) | Identifies 5-digit CBSA code provided by the Census Bureau's Geography Division | http://www.census.gov/-population/metro/ |
| C | Counties | Identifies 5-digit FIPS code | https://www.census.gov/geo/-reference/codes/cou.html |
| M | Metropolitan/Micropolitan (state part) | Identifies 7-digit code constructed from the 2-digit state FIPS code and the 5-digit CBSA code provided by the Census Bureau's Geography Division | |
| N | National (50 States + DC) | Custom code using 00 to denote national scope | |
| S | States | Identifies 2-digit FIPS code (also called "ANSI" codes) | https://www.census.gov/geo/-reference/ansi_statetables.html |

2.14 Aggregation level

([label_agg_level.csv](#))

Measures within the J2J and QWI data products are tabulated on many different dimensions, including demographic characteristics, geography, industry, and other firm characteristics. For Origin-Destination (O-D) tables, characteristics of the origin and destination firm can be tabulated separately. Every tabulation level is assigned a unique aggregation index, represented by the `agg_level` variable. This index starts from 1, representing a national level grand total (all industries, workers, etc.), and progresses through different combinations of characteristics. There are gaps in the progression to leave space for aggregation levels that may be included in future data releases.

`agg_level` is currently reported only for J2J data products.

The following variables are included in the [label_agg_level.csv](#) file:

| Variable | Description |
|-----------------------------|---|
| <code>agg_level</code> | index representing level of aggregation reported on a given record |
| <code>worker_char</code> | demographic (worker) characteristics reported on record |
| <code>firm_char</code> | firm characteristics reported on record. These will be the characteristics of the destination firm in O-D tabulations |
| <code>firm_orig_char</code> | characteristics of origin firm reported on record (O-D tabulations only) |
| <code>j2j</code> | Flag: Aggregation level available on J2J counts tables |
| <code>j2jr</code> | Flag: Aggregation level available on J2J rates tables |
| <code>j2jod</code> | Flag: Aggregation level available on J2J O-D tables |
| <code>qwi</code> | Flag: Aggregation level available on QWI |

The characteristics available on an aggregation level are repeated using a series of flags following the standard schema:

- [geo_level](#) - geographic level of table
- [ind_level](#) - industry level of table
- `by_` variables - flags indicating other dimensions reported, including ownership, demographics, firm age and size.

These flags will be expanded to include origin characteristics in a later release. A shortened representation of the file is provided below, the complete file is available in the link above.

| <code>agg_level</code> | <code>worker_char</code> | <code>firm_char</code> | <code>firm_orig_char</code> | <code>j2j</code> | <code>j2jr</code> | <code>j2jod</code> | <code>qwi</code> | <code>geo_level</code> |

3 Status flags

([label_flags.csv](#))

Each status flag in the tables above contains one of the following valid values. The values and their interpretation are listed in the table below.

Important

Note: Currently, the J2J tables only contain status flags *-1* and *1*. Status flags with values 10 or above only appear in online applications, not in CSV files.

| flag | label |
|------|--|
| -2 | no data available in this category for this quarter |
| -1 | data not available to compute this estimate |
| 1 | OK |
| 5 | Value suppressed because it does not meet US Census Bureau publication standards. |
| 6 | Value calculated from other released measures - no significant distortion |
| 7 | Value calculated from other released measures - some of which have significantly distorted data |
| 9 | Data significantly distorted - fuzzed value released |
| 10 | Aggregate of cells - no significant distortion |
| 11 | Aggregate of cells not released because component cells do not meet U.S. Census Bureau publication standards |
| 12 | Aggregate of cells - some of which have significantly distorted data |
